

EPIC: One Pipeline, Every App

The Netflix Analogy

Think of EPIC like a Netflix account.

You have **one Netflix account**. It works on every TV in your house. Each TV can play a different movie at the same time. You don't need a separate Netflix subscription for the living room, the bedroom, the kitchen, and the garage.

Netflix	EPIC
Your Netflix account	The EPIC pipeline
Each TV / room	Each application team
The movie playing	An active deployment run
Your remote + profile	The app's <code>epic.json</code> config

Nobody at home builds their own streaming service. They just press play.

How It Works

Every app team gets the same pipeline. They don't build one, maintain one, or debug one. They provide a small config file (`.pipeline/epic.json`) that tells EPIC what to build, test, scan, deploy and where. That's it.

EPIC handles the rest: authentication, testing gates, artifact management, and deployment to whatever cloud you choose.

Why This Matters

Without EPIC: 30 app teams build 30 pipelines. Each one is slightly different. Each one breaks differently. Each one needs its own expertise to fix. Security reviews multiply. Compliance audits become a nightmare. Onboarding takes weeks.

With EPIC: 30 app teams use one pipeline. It's consistent, auditable, and maintained by a single team. Onboarding takes hours. Security and compliance are baked in once, not bolted on 30 times.

The Bottom Line

We don't need every team to become a CI/CD expert. We need every team to ship their code safely and reliably. EPIC is how we do that.
